Industrial Water Equipment's reverse osmosis systems have gained intelligence and easy integration while reducing complexity and physical footprint. They now save 70 % energy per m<sup>3</sup> of water produced by incorporating Grundfos intelligent pumps and controls.

The systems have also enabled automatic, remote monitoring. This increases the machines' reliability and allows for preventative maintenance – instead of the previously required manual monitoring of the system and water quality. “We've worked with Grundfos I-Solutions to take a unit that was already successful and make it better,” says IWE's Justin Underhill.
